Review of three standalone HTML websites

Prepared from the supplied HTML source files.

## 1. Project Overview

This document describes three browser-based web pages: a personal portfolio, an online learning platform interface, and a student dashboard. Each is a standalone HTML document with embedded CSS. The portfolio and learning platform also use JavaScript for interactive behavior. No server or build tools are required to view the pages.

## 2. Website 1 — Personal Portfolio

Purpose: present a student profile and learning journey in a polished personal website.

• Hero section, introduction, and calls to action.

• About-me cards, education timeline, skill tags, hobbies, projects, and achievements.

• Resume link expecting a local resume.pdf file; contact form prepares an email draft.

• Sticky navigation, mobile menu, active-section highlighting, animated profile artwork, and reveal-on-scroll effects.

Implementation: CSS custom properties define the dark theme. CSS Grid and media queries adapt the layout. JavaScript handles the menu, active navigation, reveal animations, current year, and mailto behavior.

# 3. Website 2 — Online Learning Platform (LearnHub)

Purpose: demonstrate course discovery and learner-progress features.

• Header navigation, course search, hero area, and category filters.

• Six sample course cards with instructor, duration, rating, student count, and progress.

• Featured instructor, learning progress, popular courses, and learning objectives.

• Demo enrollment and profile actions provide feedback messages; they do not create accounts or save progress.

Implementation: responsive CSS grids and card components; JavaScript filters courses by category and search text and shows toast messages.

# 4. Website 3 — Student Dashboard

Purpose: provide a single-page overview of academic information.

• Sidebar links to student details, semester results, attendance, subjects, exams, and announcements.

• Summary cards for CGPA, attendance, and number of subjects.

• Tables for semester results, subject credits/grades, and exam schedule.

• Attendance percentages use progress bars; the layout adapts for smaller screens.

Implementation: static HTML/CSS with in-page anchor navigation. Academic details are sample values and must be verified before use.

## 5. Tools and Technologies

| Technology | Purpose |
|---|---|
| HTML5 | Structure, forms, links, cards, tables, and sections. |
| CSS3 | Themes, responsive layouts, progress bars, hover states, and animation. |
| JavaScript | Portfolio menu and scroll effects; LearnHub search, filters, and demo feedback. |
| Browser | Runs each page locally without a build step. |

## 6. How to Run

• Open any HTML file in Chrome, Edge, Firefox, or Safari.

• Edit the file with Notepad or Visual Studio Code, save, and refresh the browser.

• Place a real resume PDF next to the portfolio HTML file and name it resume.pdf if you want the download link to work.

## 7. Basic Verification Checklist

• Open all three pages in a modern browser.

• Test navigation links and responsive layouts by resizing the window.

• Test portfolio menu/contact form and LearnHub search/category filters.

• Confirm the dashboard tables and progress bars display correctly.

## 8. Limitations and Recommendations

• No backend, database, authentication, or persistent storage is configured.

• Grades, attendance, course metrics, and schedules are illustrative sample data.

• Replace portfolio placeholders and verify all information before sharing.

• Use secure, authorized server-side services if adding real accounts, bookings, or personal-data collection.

## 9. Deliverables

This package includes README.md, this documentation in PDF and DOCX formats, original HTML files, and individual/combined screenshots.
